ACKNOWLEDGMENT

The Household Income and Expenditure Survey (HIES) is a well-recognized and one of the most common welfare measurement surveys globally. Likewise, the HIES has become a flagship activity of the Bangladesh Bureau of Statistics (BBS) highly acclaimed by the stakeholders. The journey began nearly fifty years ago, two years after the independence of Bangladesh, the first round of the Household Expenditure Survey (HES) was conducted in 1973–74. Since then, BBS has conducted seventeen rounds of HES/HIES till 2022. In 2000, the thirteenth round, the HES survey was renamed as HIES by increasing more ‘income’ related questions in the Questionnaire. The seventeenth round of HIES implemented in 2022 is a landmark for its many distinct features, such as: i) the introduction of CAPI, ii) the use of weighing scale for food items, and iii) the introduction of COICOP classification of household expenditure. The survey also benefited from: (i) three weeks of residential training, (ii) two consecutive residential refresher trainings for the enumerators during the data collection, and (iii) rigorous monitoring and supervision throughout the year with feedback provided in real time to enumerators in the field, etc.

We express our gratitude to the Hon’ble Minister, Mr. M. A. Mannan MP, Ministry of Planning, and the Hon’ble State Minister, Dr. Shamsul Alam, Ministry of Planning, for their generous support and cooperation. We are highly thankful to the respected Secretary, Statistics and Informatics Division (SID), Dr. Shahnaz Arefin, ndc for her kind-hearted, valuable guidance and tireless efforts in supporting the collection of the best quality data from the field. We acknowledge the valuable suggestions and wholehearted administrative support provided by the respected Director General of BBS, Mr. Md. Matiar Rahman. Special thanks to the Additional Secretary, SID, Mr. Farooq Ahmed, and DDG, BBS, Kazi Nurul Islam for their kind support. Our sincere thanks to members of the Technical Committee, Project Implementation Committee and Project Steering Committee.

We recognize the World Bank Group for extending technical cooperation to the HIES since 2000. We are especially most grateful to the esteemed Poverty and Equity GP Team comprised of Mr. Ayago E. Wambile, Senior Economist, Mr. Faizuddin Ahmed, Senior Poverty Consultant, and Ms. Rumana Islam, Consultant, for their passionate engagement with HIES 2022. We are grateful to Mr. Md. Dilder Hossain, PD and Mr. Mohammad Salim Sarker, DPD for their continued cooperation through the NSDS-ISP, BBS specially conducting the enumerators residential trainings at BCDM, Gazipur. We are also thankful to all distinguished officials of BBS and SID who were engaged in monitoring the HIES 2022 data collection throughout the year. We extend our gratitude to all respected individuals, organizations, and agencies involved in implementing this project.

Finally, I am thankful to Dr. Dipankar Roy, Joint Secretary, SID and immediate past PD, HIES Project for his kind support to this project. I am indebted to all the ‘Enumerators Cum Data Entry Operators’, Female facilitators, and all of ‘HIES 2022 Team’ members for their utmost dedication and sincerity for this work. My heartfelt thanks to Mr. Md. Mobarak Hossen, DPD, HIES 2020–21Project, BBS, Mr. Mohammad Junayed Bhuyan, DD, BBS, Mr. Shapon Kumar, DDO, HIES 2020–21 Project, and Mr. S. M. Anwar Husain, ASO, BBS, for accomplishing both technical (preparing the CAPI interface, training, field operation, data management, and analysis) and administrative responsibilities efficiently by hard working. We are also grateful to the poverty consultants for HIES 2022, Mr. Tahidul Islam, ex-JD, BBS, and Mr. Md. Abdul Latif, ex-DD, BBS, for their necessary technical contribution. My sincere thanks to all hard-working support staff of the HIES Project, BBS, for their devoted service since the inception of the project.

We believe that the ‘Key Findings: HIES 2022’ would be extremely helpful to get a quick impression of the latest poverty profile of Bangladesh. Your kind opinion and valuable suggestions in improving the future activities of HIES would be highly appreciated.

EXECUTIVE SUMMARY

The Bangladesh Bureau of Statistics (BBS) has completed the seventeenth round of HIES from January to December 2022. In HIES 2022, BBS made significant developments by selecting the most qualified enumerators, conducting residential training, introducing CAPI, improving data collection tools, substantially increasing the number of food and non-food items based on COICOP, and implementing continuous monitoring and supervision, among others. Therefore, significant measurement enhancements have been reflected in income and expenditure aggregates. The salient features of the Key Findings for HIES 2022 are as follows:

Household living standards and socio-economic status have improved:
The HIES 2022 data finds that household-level access to electricity increased to 99.3% in 2022 from 75.9% in 2016 and 55.3% in 2010. Similarly, 92.3% of HHs have access to improved toilet facilities, and 96.1% have access to improved source of drinking water. Notably, Bangladesh’s literacy rate (7 years and over) rose significantly to 74.0% in 2022 from 65.6% in 2016 and 57.9% in 2010.

Household monthly income has increased significantly:
The household’s average monthly income has increased in nominal terms to TK. 32,422 in 2022, from Tk. 15,988 in 2016 and TK. 11,479 in 2010.

Household monthly total expenditure has increased:
The HIES 2022 data reveals that the HH’s monthly total expenditure has increased nominally to TK. 31,500 in 2022 from TK. 15,715 in 2016 and TK. 11,200 in 2010.

The consumption pattern has changed over time:
The HIES 2022 data illustrates that the share of food and non-food consumption expenditures in the HHs has changed. Non-food expenditures are increasing gradually. The percentage of food consumption expenditure is 45.8%, and non-food consumption expenditure is 54.2% in 2022, compared to 47.7% for food and 52.3% for non-food in 2016.

Average calorie intake has increased significantly:
The calorie intake per person per day is 2,393.0 kcal in 2022 which was 2,210.4 kcal in 2016, and 2,318.3 in 2010.

Poverty Profile of Bangladesh in 2022:
The headcount rate (HCR) in 2022 using the upper poverty line is 18.7% at the national level, 20.5% in rural areas, and 14.7% in urban areas. On the other hand, the HCR using the lower poverty line is 5.6% at the national level, 6.5% in rural areas, and 3.8% in urban areas in 2022. These statistical figures provide a snapshot of Bangladesh’s current poverty status.

Inequality:
The income Gini coefficient is 0.499 in 2022, compared to 0.482 in 2016 and 0.458 in 2010. On the other hand, the consumption Gini coefficient is 0.334 in 2022, 0.324 in 2016, and 0.321 in 2010. It shows that the concentration of income is slightly increasing.

Households’ financial inclusion is gradually increasing:
In 2022, approximately 14.1% of HHs had at least one member who opened a bank account during the last 12 months which doubles the rates in 2016 (7.5%), and 2010 (7.4%). This evolution presents a clear picture of the gradual improvement toward the financial inclusion of the HHs.
This chapter deals with household and Demographic characteristics obtained from HIES 2022. It includes average household size, sources of drinking water, access to electricity, toilet facilities, household composition, sex ratio, literacy rate etc. These estimates derived from the survey results have been compared with the earlier rounds of HIES. It is worth mentioning that inter HIES comparison should be done with caution because of the differences in concepts and definitions.
AVERAGE HOUSEHOLD SIZE
Household size refers to the average number of household members.

4.26
The average household size in the Household Income and Expenditure Survey 2022 is 4.26.

4.30
The average Household size in rural areas obtained from the HIES 2022 survey is 4.30. It is greater than that of urban areas in all of the survey years.

4.18
Household size in urban areas of Bangladesh found from the survey is 4.18. It may be attributed to the lower fertility rate in urban areas.
MALE AND FEMALE-HEADED HOUSEHOLD

Head of household means a member of the household who is the decision-maker regarding the different activities of the household. This household is also being run under his command. In case of the Household Income and Expenditure Survey (HIES), a member is regarded as the head of a household whom the other members consider him so. Generally, the eldest male or female earner of the household or the main decision-maker is considered to be the head of the household.
**SEX RATIO**

Sex ratio is the proportion of males to females in a population as expressed by the number of males per hundred females.

The survey shows that there are 100.8 males per 100 females in 2022. This ratio varies between rural and urban areas. It is 100.6 in rural areas and 101.2 in urban areas.

**Sex ratio: HIES 2022, HIES 2016 and HIES 2010 by residence**
**LITERACY RATE (7 YEARS & OVER)**

Literacy rate refers to the percentage of the population who are able to both read and write.

**74.0%**

The HIES 2022 reveals that literacy rate of the population aged 7 years and above is 74.0% at the national level for both sexes.

**70.3%**

The rate of literacy in rural areas is 70.3% which is slightly lower than the national average.

**82.0%**

The urban literacy rate is 82.0% which is higher than the national average.

Literacy rate: HIES 2022, HIES 2016 and HIES 2010 by residence
households reported in HIES 2022 that they have access to electricity (National Grid/Solar electricity) in Bangladesh. In rural areas this rate is 99.14% and 99.78% in urban areas.

Access to electricity: HIES 2022, HIES 2016 and HIES 2010 by residence

HIES 2022 illustrates that 19.34% of the households used supply water as a main source of drinking water.

76.81% of the households used tube-well as a main source of drinking water.

3.85% of the households used other sources of water, such as, ponds, rivers, canals, wells etc. as a main source of drinking water.

Sources of drinking water: HIES 2022, HIES 2016 and HIES 2010 by residence
92.32% of households reported that they have access to improved toilet facilities.

6.99% of the households reported that they have access to unimproved toilet facilities.

0.69% of the households openly defecate, i.e., they do not have any toilet facilities.

This chapter discusses the estimates of household income and expenditure based on the findings from Household Income and Expenditure Survey (HIES) 2022. Income and expenditure estimates are central to the entire findings of the Survey. It includes monthly household income and expenditure, consumption expenditure, food and non-food expenditure etc. These estimates derived from the survey results have been compared with the earlier HIES.
Income per household

HIES 2022 reports the average monthly household income is Tk. 32,422 at the national level, Tk. 26,163 in rural areas, and Tk. 45,757 in urban areas. Reported values in HIES 2016 were Tk. 15,988 for the national average, Tk. 13,998 in rural areas, and Tk. 22,600 in urban areas. HIES 2010 reported Tk. 11,479 as the national average monthly household income, with Tk. 9,648 and Tk. 16,475 for the rural and urban area averages, respectively.

Income per capita

Average monthly per capita income reported at the national level in HIES 2022 is Tk. 7,614 while this is Tk. 6,091 and Tk. 10,951 in rural and urban areas, respectively. In contrast, HIES 2016 figures showed an average national income per capita of Tk. 3,940, with rural and urban areas averaging Tk. 3,261 and Tk. 5,752, respectively. The 2010 HIES indicated an average of Tk. 2,553 for the national figure, Tk. 2,130 in rural areas, and Tk. 3,741 in urban areas.
EXPENDITURE

**Total expenditure per household**

HIES 2022 estimates the total monthly household expenditure at Tk. 31,500 at the national level, Tk. 26,842 in rural areas, and Tk. 41,424 in urban areas. HIES 2016 reported lower totals of Tk. 15,715 for the national level, Tk. 14,156 in rural areas, and Tk. 19,697 in urban areas. In HIES 2010, this figure for the national total was Tk. 11,200 and Tk. 9,612 and Tk. 15,531 in the rural and urban areas, respectively.

**Consumption expenditure per household**

Monthly average household consumption expenditure is estimated at Tk. 30,603 in HIES 2022 with estimates of Tk. 26,207 in rural areas and Tk. 39,971 in urban areas. In contrast, HIES 2016 reported lower estimates of Tk. 15,420 at the national level, Tk. 13,868 in rural areas, and Tk. 15,276 in urban areas. In HIES 2010, the national average household consumption expenditure was Tk. 11,003 with rural and urban areas reporting averages of Tk. 9,436 and Tk. 15,276, respectively.
FOOD AND NON-FOOD CONSUMPTION EXPENDITURE

Food Consumption Expenditure

HIES 2022 estimates the national monthly average food consumption expenditure at Tk. 14,003. This estimate is Tk. 13,125 in the rural areas and Tk. 15,875 in urban areas. Comparatively, HIES 2016 estimates lower averages at Tk. 7,354 for the national figure and Tk. 7,001 and Tk. 8,254 for rural and urban areas, respectively. HIES 2010 estimates Tk. 6,031 as the national average food consumption expenditure with Tk. 5,543 in rural areas and Tk. 7,362 in urban areas.

Monthly average for non-food consumption expenditure is estimated at Tk. 16,600 at the national level in 2022. Reported values for rural and urban areas are Tk. 13,082 and Tk. 24,097, respectively. HIES 2016 finds the national monthly average Tk. 8,066, Tk. 6,866 in rural areas and Tk. 11,129 in urban areas. The HIES 2010 estimates at the national level Tk. 4,972 and Tk. 3,893 in rural areas and Tk. 7,914 in urban areas.
Inequality refers to a situation where there is a disparity or uneven distribution of resources, opportunities, or benefits among different individuals or groups. This chapter presents the income and consumption inequality obtained from HIES 2022. These estimates derived from the survey results have been compared with the earlier HIES.
INCOME INEQUALITY

0.499

Income Gini

The concentration of income has slightly increased as per HIES 2022. The overall Gini coefficient of income has increased to 0.499 in HIES 2022 from 0.482 in HIES 2016 and 0.458 in HIES 2010.

CONSUMPTION INEQUALITY

0.334

Consumption Gini

The concentration of consumption has slightly increased as per HIES 2022. The overall Gini coefficient of consumption has increased to 0.334 in HIES 2022 from 0.324 in HIES 2016 and 0.321 in HIES 2010.
Information about consumption of different items of food in terms of quantity and calorie by the people has been presented in this chapter. Food is essential for survival and adequate intake of balanced food with required nutrients is vital for leading a healthy and productive life. Consumption of food items is highly dependent on the availability food, its price level and also food habits. Seasonal variations in prices of food items, especially in the case of cereals, fruits and vegetables are apparent. Therefore, increases or decreases in the quantity of food consumed is interpreted taking these factors into consideration.
**FOOD INTAKE** (Gram per capita per day)

- **Rice** (fine, medium and coarse combined): 328.9g
- **Wheat**: 22.9g
- **Pulses**: 17.1g

The overall calorie intake per capita per day is 2393.0 K.cal in HIES 2022. Per capita per day calorie intake was 2210.4 K.cal and 2318.3 K.cal in HIES 2016 and HIES 2010, respectively.

The Calorie Intake is higher in rural areas (2424.2 K.cal) compared to urban areas (2324.6 K.cal). The scenario was similar in 2016 (2240.2 K.cal in rural areas and 2130.7 K.cal in urban areas) and 2010 (2344.6 K.cal in rural areas and 2244.5 K.cal in urban areas).

The Bangladesh Bureau of Statistics (BBS) has started measuring poverty by using the Cost of Basic Needs (CBN) method since the thirteenth round of HES 1995–96. Before that, BBS used both direct calorie intake (DCI) and food energy intake (FEI) methods in the previous rounds of HES in Bangladesh. In fact, the CBN method was recommended by the World Bank and has now become a popular and widely used method by the many national statistical offices (NSOs) globally for measuring consumption-based, unidimensional absolute poverty. In HIES 2022, the CBN method has been followed for poverty estimation. This chapter includes Head Count Rate using upper and lower poverty lines, Poverty Gap and Squared poverty Gap, calculated following CBN method.
INCIDENCE OF POVERTY

HCR OF HIES 2022 BASED ON UPPER POVERTY LINES (UPL)

18.7%

By using the upper poverty lines of HIES 2022 the Head Count Rate (HCR) are estimated at 18.7 percent at the national level, 20.5 percent in rural area, and 14.7 percent in urban area. However, as per the official poverty numbers of HIES 2016 the HCR were estimated at 24.3 percent at the national level, 26.4 percent in rural area, and 18.9 percent in the urban area which was estimated at 31.5 percent at the national level, 35.2 percent in rural area and 21.3 percent in the urban area in HIES 2010.

HCR OF HIES 2022 BASED ON LOWER POVERTY LINES (LPL)

5.6%

By using the lower poverty lines of HIES 2022 the Head Count Rate (HCR) are estimated 5.6 percent in national level, 6.5 percent in rural area and 3.8 percent in urban area. As per the official poverty numbers of HIES 2016 the HCR were estimated 12.9 percent in national level, 14.9 percent in rural area and 7.6 percent in urban area which were estimated 17.6 percent in national level, 21.1 percent in rural area and 7.7 percent in urban area in HIES 2010.
It is worth mentioning that the HIES 2022 poverty estimates are not strictly comparable with the previous rounds of HIES estimates. Because in HIES 2022, the substantial developments complied while execution and comprehensiveness of the food and non-food items (COICOP) covered in the questionnaire. However, the back calculation, which required more time for the earlier rounds, is under way, and it will be reflected later on in the main report of HIES 2022.

POVERTY GAP (PG)

3.8%

The Poverty Gap (PG) is the ratio by which the mean consumption/income of the poor falls below the poverty line, which is measured using the FGT method. The Poverty Gap (PG) helps us have an idea about the depth of poverty among the population, i.e., the distance of the poverty-prone HHs from the poverty line. It is evident from the HIES 2022 that the PG is narrowing gradually over time irrespective of national, rural, and urban areas, both in terms of upper and lower poverty lines.

The table below shows the Poverty Gap (UPL) and (LPL) for HIES 2010, HIES 2016, and HIES 2022 by residence:

Poverty Gap: HIES 2022, HIES 2016 and HIES 2010 by residence

KEY FINDINGS: HIES 2022
The Squared Poverty Gap (SPG) measures the severity of poverty using the FGT method. The HIES 2022 reveals that the SPG is also reducing gradually over time, irrespective of national, rural, and urban areas, both in terms of upper and lower poverty lines.

This chapter deals with internal and external migration, financial inclusion like bank account opening, deposit, etc., loans from financial institution or friends and relatives, savings in formal and informal sector and average amount of loan per household etc. obtained from HIES 2022. The estimates derived from the survey results have been compared with the earlier HIES.
MIGRATION

Information regarding migration of any household member was collected. Migration is related to the movement of any household member within the country or abroad during the last five years.

10.47% of the households in HIES 2022 reported migration either within the country (from one district to another) or abroad. Among them, 2.25% households reported migration within the country and 8.33% reported migrating abroad.

Migration rate is higher in rural areas compared to urban areas for both types of migration. The migration rate was 11.64% in rural areas and 7.98% in urban areas in HIES 2022.
FINANCIAL INCLUSION

OPENED A BANK ACCOUNT

14.12% of households in HIES 2022 had at least one member open a bank account during the last 12 months of interview. This percentage represents an increase from 7.5% in HIES 2016 and 7.41% in HIES 2010.

7.5% IN HIES 2016

7.41% IN HIES 2010

In HIES 2022, 13.39% of households in rural areas and 15.65% households in urban areas had at least one member open a bank account in the past 12 months. These percentage marked an increase from 7.6% and 7.3% in rural and urban areas respectively in HIES 2016, and from whereas 5.05% and 13.85% in rural and urban areas respectively in HIES 2010.
DEPOSITED MONEY WITH MICRO/ FINANCIAL INSTITUTIONS

21.30% of households in HIES 2022 deposited money in a micro/ financial institution during the last 12 months. This percentage was 15.09% and 14.51% in HIES 2016 and HIES 2010, respectively.

<table>

<td>12.20</td>
</tr>
<tr>
<td>HIES 2010</td>
<td>15.94</td>
<td>10.61</td>
</tr>
</tbody>
</table>

In HIES 2022, 21.04% households in rural areas and 21.85% households in urban areas made deposit in at least one of the micro/financial institution within the last 12 months. This percentage represents an increase from 17.30% and 12.20% in rural and urban areas respectively in HIES 2016 and from 15.94% and 10.61% in rural and urban areas respectively in HIES 2010.

DEPOSITED MONEY WITH INFORMAL FINANCIAL INSTITUTIONS

6.91% of households in HIES 2022 deposited money with an informal financial institution during the last 12 months. This percentage was 5.30% and 5.64% in HIES 2016 and HIES 2010, respectively.

<table>

<td>5.70</td>
</tr>
<tr>
<td>HIES 2010</td>
<td>5.80</td>
<td>5.22</td>
</tr>
</tbody>
</table>

7.08% of households in HIES 2022 in rural areas and 6.56% of households in urban areas deposited money with an informal financial institution during the last 12 months. This percentage demonstrate a rise from 5.10% and 5.70% in rural and urban areas respectively in HIES 2016 and 5.80% and 5.22% in rural and urban areas respectively in HIES 2010.
37.03% of households received loans from financial institutions and/or friends, etc. during the last 12 months preceding the day of enumeration in HIES 2022. This percentage represents an increase from 29.70% in HIES 2016 and 32.03% in HIES 2010. The proportion of households received loans is higher in rural areas (39.35%) compared to urban areas (32.11%).

### Average Amount of Loans Taken Per Household

During the last 12 months, the average amount of loans taken per household in HIES 2022 was Tk. 70,506. This amount represents an increase from Tk. 37,743 and Tk. 28,062 in HIES 2016 and HIES 2010, respectively.

The average loan amount in urban areas was higher than that in the rural areas. During the last 12 months, the average amount of loans taken per household in HIES 2022 was Tk. 41,921 in rural areas and Tk. 1,31,395 in urban areas. This amount was Tk. 31,332 and Tk. 59,728 in rural and urban areas respectively in HIES 2016, and Tk. 21,804 and Tk. 54,122 in rural and urban areas respectively in HIES 2010.
REFERENCES

ANNEXURES

ANNEX 1

CONCEPTS AND DEFINITIONS

Access to Electricity
Percentage of households with access to electricity from the national grid or solar.

Calorie
Calorie is a unit of energy that is commonly used to measure the energy content of food and drinks. It is defined as the amount of energy required to raise the temperature of one gram of water by one degree Celsius. Calorie is often used in the context of human nutrition and diet, where it is used to describe the amount of energy that is obtained from consuming food or burned through physical activity. The kilocalorie (kcal) is a more commonly used unit in nutrition and is equal to 1000 calories.

Durable Goods
Durable goods are those whose individual life expectancy is one year or more. These include machinery, furniture, TV, motor car, computer, laptop etc.

Food Poverty Line
The food poverty line is the threshold that measures the minimum amount of income required to purchase a nutritionally adequate diet. It takes into account the cost of food and the nutritional needs of an individual. The basic consumption bundle consists of eleven items: coarse rice, wheat, pulses, milk, oil, meat, fish, potatoes, other vegetables, sugar and fruits. This basic consumption bundle provides minimal nutritional requirements corresponding to 2122 kcal per day per person.

Household
Household is a dwelling unit where one or more persons live and eat together under a common cooking arrangement. Household is considered to consist of all the people who live in a single housing unit, regardless of their relationship with each other. This includes family members, roommates, or other individuals who share a living space.

Household Head
Head of household means a member of the household who is the decision-maker regarding the different activities of the household. This household is also being run under his command. In case of the Household Income and Expenditure Survey (HIES), a member is regarded as the head of a household whom the other members consider him so. Generally, the eldest male or female earner of the household or the main decision-maker is considered to be the head of the household.
**Household Expenditure**
Household expenditure includes household consumption and certain other outlays of the household. Consumption expenditure of the household is the aggregate value of goods and services actually consumed during the reference period. The non-consumption expenditure of the household includes income tax and other taxes, pension and social security contributions and related insurance premium, gifts and other transfers. Items extended from the expenditure schedule are additions to saving, various types of investment expenditure (both monetized and non-monetized) including the amount spent.

**Household Income**
Income means material return in cash or kind received in exchange of goods and services in a particular period. In case of household income, it refers to the material return of all the members of the household in the same period. So, household income in a particular period can be defined as the sum of the earnings of all the members of the household in cash or kind in the same period of time. Income from wages and salaries, pensions, contributions and professional fees earned by the members of the household are estimated on yearly basis. Income from interest, dividends, earnings from agricultural activities, business, commercial and industrial establishments, land and property, rent, gifts and assistance and insurance benefits, including other special types or receipts by the member of the household are also estimated on yearly basis.

**Household Member**
Household members are permanent family members, as well as, boarders and lodgers, servants and other employees who often live in the household and take food together. These also included persons temporarily away from the household, persons whose usual place of residence was elsewhere but found staying with the household at the time of enumeration have not deemed a member of the household. Guests visiting a household temporarily or a person who normally resides and takes food outside is not considered a member of the household for the survey.

**Household Size**
Household size refers to the average number of household members.

**Improved Toilet Facilities**
Improved toilet facilities are those that “ensure hygienic separation of human excreta from human contact,” Improved sanitation facilities include flush or pour-flush to piped sewer systems, septic tanks or pit latrines, ventilated improved pit latrines, pit latrines with slabs and composting toilets.

**Inequality**
Inequality refers to a situation where there is a disparity or uneven distribution of resources, opportunities, or benefits among different individuals or groups.

**Literacy Rate**
Literacy rate refers to the percentage of the population who are able to both read and write.

**Migration**
The movement of persons away from their usual place of residence either across an international border or within the country.

**Non-Durable Goods**
Items whose durability is less than one year are termed as non-durable goods. These are food items, clothing, fuel and lighting, medicines, etc. Services are also treated as non-durable goods.
**Open Defecation**
Open defecation is the practice of people defecating in the open, such as in fields, forests, bushes, bodies of water, beaches or other open spaces or with solid waste, rather than using a toilet or other designated sanitation facility.

**Poverty Gap (PG)**
The poverty gap index measures the extent to which individuals fall below the poverty line (the poverty gaps) as a proportion of the poverty line. The sum of these poverty gaps gives the minimum cost of eliminating poverty, relative to the poverty line.

**Poverty Line**
The poverty line is a threshold used to define the minimum level of income or resources necessary to meet the basic needs of an individual. The poverty line is the sum of the food poverty line and non-food allowance.

**Sex Ratio**
It is the number of males per hundred females. Sex ratio = (number of male / number of female) * 100

**Squared Poverty Gap (SPG)**
The squared poverty gap index (also known as the poverty severity index) averages the squares of the poverty gaps relative to the poverty line. It allows one to vary the amount of weight that one puts on the income (or expenditure) level of the poorest members in society.

**Supply/Piped Water**
Water supplied by local government or any other entity to the dwelling household, compound, yard or plot, to neighboring household through pipe or public tap/standpipe are considered as supply water.
ANNEXURE

ANNEX 2

SAMPLING DESIGN OF HIES 2022

Sampling Design of HIES 2022
For HIES 2022, a two-stage stratified cluster sampling design was followed under the sampling frame developed from the available second zonal operation of Population and Housing Census 2022. The primary sampling unit (PSU) was the Enumeration Area (EA) of the Population and Housing Census 2022. Each EA is a cluster of around 100 households.

At the first stage, required number of PSU’s were selected and a complete household listing was carried out in the selected PSU’s. Then at the second stage, 20 households were selected randomly from each selected PSUs for interview in the field.

Sample Size:
For designing the sample for HIES 2022, two different target variables/indicators were used. These are: (i) Prevalence rate of the main indicator (poverty head count ratio) (ii) Nominal household consumption expenditure. These were considered as the core indicators of HIES. Using both the indicators, rough calculation showed that about 900 households or 45 PSU’s (as 20 households were selected in each PSU) for each domain (division by rural & urban) were required to provide a reasonably precise estimate at domain level.

Formula used for the estimation of sample size:
The sample size is usually determined at the domain level from which separate estimate is derived. From general theory, the minimum required sample size is determined by the usual sample size determination formula for estimating mean, which is given by

\[
n = \left( \frac{Z_{a/2} \times CV_{SRS(9)}}{r(\bar{y})} \right)^2 \times DEFF
\]

where \(n\) is the minimum sample size required for allocation to each division in order to achieve a certain level in the accuracy statistic \(r(\bar{y})\) associated with the targeted variable \(\bar{y}\), \(CV_{SRS(9)}\) is the coefficient of variation of the targeted variable estimated under the assumption of simple random sampling; \(DEFF\) is the design effect of the target variable; and \(Z_{a/2}\) is the critical value of a standard normal distribution with \(\alpha\%\) level of significance.

To allow a relative margin of error 9% (which was 10% in HIES 2016/17 as the district was domain, but here in HIES 2022 division was considered as domain which allowed less margin of error compared to district level domain) with coefficient of variation for average monthly household consumption expenditure, \(CV=0.907652\) (HIES 2016/17) and a factor for the design effect 2.3 at 95% level of confidence (\(z=1.96\)), the minimum required sample size for a single domain would be 898.66 \(\approx\) 900 households. Since there are 16 domains (2 domains viz. rural and urban in each of the 8 divisions), the ultimate sample size was estimated at 14400 (900×16) households spreading across the country through 720 primary sampling units (PSUs) with 20 households per PSU.
Distribution of Sample PSU’s: HIES 2022

KEY FINDINGS: HIES 2022
METHODS OF POVERTY MEASUREMENT

Steps to the Construction of Poverty Lines by Using the CBN Method
Through the Cost of Basic Needs (CBN) method, two poverty lines are constructed for each of the domains:

1. upper poverty line; and
2. lower poverty line

To calculate these two poverty lines, we had to follow the steps below:

The first step-
1. Calculated the price of a normative food basket containing eleven items (such as rice, wheat, pulses, milk, oil, meat, fish, potatoes, other vegetables, sugar, and fruits) that provides minimal nutrition requirements corresponding to 2122 kcal per person per day.

2. Calculated the median value of the unit price of each item in the basket reported by a reference group of the households (2 to 6 decile groups). This calculation was separately done for each of the sixteen (16) predetermined domains or geographical areas.

The second step-
Calculated two non-food allowances for non-food consumption.

- For the “lower non-food allowance,” taken the median amount spent on non-food items by a group of households whose per capita consumption expenditure is close to the food poverty line (the price of a food basket).
- For the “upper non-food allowance,” the median amount spent on non-food items by a group of households whose per capita food expenditure is close to the food poverty line taken.

The Third Step-
Upper Poverty Line = Cost of Food Basket + Upper Non-Food Allowance
Lower Poverty Line = Cost of Food Basket + Lower Non-Food Allowance

History of the Poverty Lines of Last Five Round of HIES by BBS:

*Re-estimation involves pricing the same food basket (11 food items) to the 2005 and 2022 respectively.
WHAT’S NEW IN HIES 2022?

Data Collection Method
- Introduction of CAPI (Computer Assisted Personal Interviewing) instead of CAFÉ method;
- Provided a weigh scale for HH’s food consumption quantity to every enumerator in HIES 2022, which was a very helpful and effective approach to ensuring the data quality by taking the accurate weights. In earlier rounds, the enumerators used to guess the consumption quantity while HHs visits; and
- Provided a Diary to each HHs for keeping the notes on food and non-food consumption and quantity;

New inclusions in HIES 2022 Questionnaire
- Introduced COICOP (Classification of Individual Consumption by Purpose) for Food and Non-Food Consumption module;
- Number of Food Items has been increased to 263 in HIES 2022 from 149 in HIES 2016;
- Number of Non-Food Items has been increased to 441 in HIES 2022 from 216 in HIES 2016;
- Questionnaire is updated based on SDGs including questions on Health, Maternity, Child mortality, Financial Inclusion, Mobile and Internet use, etc.;
- Included separate sub-section for COVID-19 and its vaccination; and
- Included a separate section on Food Security to measure FIES;

New Horizon in Training
- Three-week Residential Training of 84 (Eighty-Four) Enumerator Cum Data Entry Operators and 08 (Eight) Data Entry Monitoring Supervisors by national and international experts with special support from the World Bank through NSDS Implementation Support Project, BBS;
- Three (03) days residential training for 64 District and 08 divisional officials, the field coordinators, for effective engagement with HIES 2022; and
- Conducted two consecutive three (03) days residential refresher training for the Enumerator Cum Data Entry Operators during data collection.

Effective Monitoring and Supervision During Data Collection
- Continuous monitoring and supervision were ensured by field-level officials, the Project team and especially by the Data Entry Monitoring Supervisors of HIES project;
- Round the year continuous strong supervision by the BBS officials as well as by the SID officials; and
- Field monitoring by the Hon’ble Planning Minister, Hon’ble State Minister for Planning, frequent field visit by the respected secretary, SID; by the respected member (secretary), GED, The World Bank’s representatives and also by the development journalist community during data collection.

HIES 2022 TEAM: AT A GLANCE

A. Core Team Members
- Mr. Mohiuddin Ahmed MPH, Project Director, HIES 2020-21 Project, BBS
- Mr. Md. Mobarak Hossen, Deputy Project Director, HIES 2020-21 Project, BBS
- Mr. Mohammad Junayed Bhuyan, Deputy Director, BBS
- Mr. Shapon Kumar, Statistical Officer & DDO, HIES 2020-21 Project, BBS
- Mr. S M Anwar Husain, Assistant Statistical Officer, BBS

B. Consultants
- Mr. Faizuddin Ahmed, Senior Poverty Consultant, World Bank (Ex-PD, HIES Project, BBS)
- Mr. Md. A K M Tahidul Islam, Consultant, HIES 2020-21 Project, BBS
- Mr. Md. Abdul Latif, Consultant, HIES 2020-21 Project, BBS

C. Support Team, HIES 2022
- Mr. Majharul Islam Billal, Data Entry Monitoring Supervisor
- Mr. Naim, Data Entry Monitoring Supervisor
- Mrs. Mahfuza Hossain, Data Entry Monitoring Supervisor
- Mrs. Sharmin Khanom, Data Entry Monitoring Supervisor
- Mrs. Afroza Sultana, Data Entry Monitoring Supervisor
- Mr. Taposh Kumar Mondal, Data Entry Monitoring Supervisor
- Mr. Md. Foysal, Data Entry Monitoring Supervisor
- Mr. Nuran Nobi, Photo Copy Operator, BBS
- Mr. Md. Tohidur Rahman, Office Assistant
- Mr. Md. Mostofa, Office Assistant
- Mrs. Samuja Begum, Office Assistant
- Mr. Md. Jahid, Driver
- Mr. Md. Alauddin, Driver
